IntelliWorker Security Review for Fileservers

Information Security is a subject of increasing importance. Loss or leakage of sensitive information is something all organizations want to avoid. Information Security is about protecting own reputation, customer relationships and competitiveness.

An important although often overlooked aspect of information security is security inside the organization. There are huge numbers of information and documents which should only be available for selected users and groups. Severe consequences may occur if internal information are available for all employees

Fileservers are an exposed area with significant security challenges. This is mainly due to:

- The servers contain large amounts of information
- They are not equipped with advanced security mechanisms or admin-tools
- The servers have been in operation for a long time with significant freedom for the users.

The security problems on file servers often occur by accidental changes in connection with moving or copying information. A small mistake can during a longer period of time result in large deviations. It is difficult to protect against human errors in a busy working day. As an example, an employee who moves a

” In Asker Municipal we have used the IntelliWorker Security Review for Fileservers to ensure internal security. The tool has assisted us largely by identifying incorrect security settings on several and important documents. We are very grateful for finding these errors ourselves, reading about it in the press would be a much worse scenario. ”

In addition, it is almost impossible to track the changes or monitor these changes. However, the consequences can become evident and severe if the affected file domains contain sensitive information. This solution, the IntelliWorker Security Review for Fileservers, contributes to find and correct these security threats.

The solution analyses all security settings on the file servers within the scope defined by an administrator. All deviating read accesses compared to the parent folders are reported as suspected items.

After the analyse phase, the administrator will be presented with a report containing statistics about all instances of deviating read accesses. This will assist the administrator in correcting the irregular permissions, and directly correct the deviations. The solution has a straightforward graphical user interface where it is possible to simultaneously see the details for each user, and to perform the required actions. Adjustment must be confirmed by the administrator and all changes are logged.

IntelliSearch Enterprise Search

IntelliSearch Enterprise Search is an advanced search solution that includes all relevant systems and information sources within an organization. For more information, please contact us on the details below, or download the product sheet from our web page
